

### Specifications

#### OB-van parking

- The ICM has 4 OB-van parking spaces for multiple vehicles with a total of 6 patch rooms. The patch rooms can be used to relay audio and video signals from all of the rooms and halls at the ICM as well as various communications lines: 2-wire, 4-wire, network, fiber optic (multimode, single mode upon request). The exact location of the OB-van parking spaces and the patch-room equipment can be found on our map.

#### Video broadcasts

- All common video formats can be broadcast in high-quality via fiber-optic cable, including from the ICM to an exhibition hall.

#### Broadband network

- The ICM's existing broadband network is able to accommodate two digital feeds. This makes it possible, for example, to broadcast a live camera image from one hall throughout the entire ICM, or alternatively throughout the entire exhibition grounds with one TV set. One channel has a fixed DVB-C feed. Signals are fed to the digital network via HDMI.
